TITLE: Auto-immunization and auto-allergization in preliminary x-ray treated guinea pigs infected with tuberculosis

SOURCE: Bulgarska akademiya na naukite, v. no. 2, 1965, 165-168

TOPIC TAGS: immunology, experiment animal, biochemistry, immunization, radiology, radiation biologic effect, tuberculosis

ABSTRACT: [English article] It was established in previous investigations by the authors (Mzv. Mikrobiol. in-t. BAH, 15, 1963, 115; Immunitaets- u. Allergieforsch., 125, 1963, 207) that complement-fixing leuco-, pulmo-, and cerebro-antibodies could be detected in the serum of some tuberculous patients with chronic empyema. Comparing this with the findings of other researchers who found leucosagulins in patients with splenic tuberculosis (see, e.g., S. Moeschlin, Acta Scand. Suppl., 312, 1956, 513) and pulmoantibodies in patients with cavernous lung tuberculosis (A. T. Hannas et al., Amer. J. Resp. Dis., 83, 1961, 351), the authors stressed the role of tuberculosis infection in the induction of a 'polyspecific' auto-immunization process in

Card 1/2

L 4353-66

ACC NR: AP5028779

the affected organism. Experimental studies, part of which are the subject of the present communication, were performed with the aim of further elucidating this problem. As has been shown in the guinea pig infection model, it seems that mycobacterium tuberculosis humanum, strain H₃₇Rv, plays a significant role in inducing auto-antigenicity of a 'polyspecific' character. The pre-treatment with 400 r irradiation, producing conditions for a wider spread and deeper penetration of the infection, increases the possibilities of inducing auto-antigenicity and accelerates the autoimmunization process. Irradiation causes inhibition (up to the 30th day) of the delayed type of hypersensitivity in animals infected with tuberculosis. In some cases only auto-sensitization with respect to extracts of lymph node, brain, and peritoneal leucocytes is established on the 30th day or later after the infection. The induction of auto-antigenicity in the concrete case might be ascribed rather to the infection's direct action (the effect of irradiation being added to it) upon the tissues than to changes in the immunological competence of the antibody-forming cells caused by the radiation. The work was presented by A. Toschkoff, Corresponding Member of BAI, 30 Sep 64. Orig. art. has: 2 tables. [JPRS]

TITLE: Study of antigenic relations between HeLa-cells and human spermatozoa

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 9, 1965, 887-890

TOPIC TAGS: antigen, cytology, biologic reproduction

ABSTRACT: Following their earlier investigations conducted in two separate groups (see, e.g., I. I. Podoplelov et al., Zhurn. eksper. biol. i med., 8, 1964, 85; R. Popivanov, V. Kh. Vulchanov, Ibid., 2, 1965, 110), the authors started in 1964 joint investigation concerning the possible antigenic kinship between human spermatozoa and the HeLa cells. The present article gives an account of the material used and the experimental results achieved. The overall analysis leads to the conclusion that HeLa cells as well as human erythrocytes and spermatozoa contain the O(H) isoantigen and one more antigen common to the three cell types, most probably with a species specificity. The theoretical foundation of the problem and a detailed description of the experiments will be published elsewhere (G. P. Tribulev, et al., Eksper. med. i morfol., 4, 3, 1965). This paper was presented by Al. Toshkov, Corresponding Member BAA, on 25 May 1965. [JPRS]

ABSTRACT	: Diesel fuels currently produced in the Bulgarian Peoples Republic include fuels for high-speed diesels (straight-run kerosene-gas oil fractions representing 23-25% by wt of the crude) and heavy fuel oils (a mixture of 25% gas oil and 75% naphtha). The authors compare the indexes of Soviet and Bulgarian diesel fuels and emphasize the shortcomings of the latter (lower cetane numbers, increased sulfur content, increased viscosity, etc.) and make suggestions on the rationalization
